Do you remember ever entering "!Me" or my name into the program at any time?

Despite the similarities to an e-mail program, it's not obvious to doubleclick on transactions.
There's no critical info in there so it's fine for now. I hadn't thought of the context menu, I'll plan
to use that in the future.

Sure, it's 1GtkM4wviwohP192tec9g83hd9X5qtbk9j

I'll send back +0.01 as a confirmation.

It looks just the same with any amount. If you want to see more details of what's going on
internally, run it as bitcoin -debug and it'll show a debug print with the transaction details. It
basically selects the closest combination of coins to the amount and writes a transaction with the
change going back to yourself.

I uploaded bc015a.rar with the changes we've been discussing to:
http://www.upload.ae/file/14702/bc015a-rar.html

I'm going to release 0.1.5 soon.
